

We want to share a proposal on design adjustments for the following games:

Cycling race

Rolling in Cotton Candy

Ball-rolling on Collapsing Floor

For those games, we want to propose we have our characters riding this new design of vehicle related to the gadget vehicle of the CITH.

Reasons:

- The team was challenged on looking for something to be used in the Rolling in Cotton Candy game, something that grabs the candies fitting the world of CITH. They think of a machine that swallows them and the team thinks that the vehicle-gadget of the book fitted perfectly for the job. After evaluating gameplay needs, they came up with a morphing of the car into a Motorcycle that can still use the gadgets, and that could be used in some other games. Making it more fun, more unique and more related to CITH.

- We have various options for the motorcycle controls, but they'll keep current directional style movement (like normal walking in the title, NOT like a real car/bike). Turn around could be happening with a bit of inertia similar to the rolling a ball control expected for the original design of the game (dressed with skid animations), but also could be by turning around and moving into the direction, after the direction is set.

- This implementation will save us headaches for animations and other technical difficulties of walking over a rolling ball classic set up.

All of these things are making the team want to push in this direction for those minigames.
