

ABDALLAH MAALIKI

Game Programmer | C++ | Unreal Engine | Engine & Tools

+965 9403 6429 • abd.maaliki@outlook.com • abdallahmaaliki.com • github.com/folayfila • Hawally, Kuwait

SUMMARY

C++ game and engine programmer with 3 years of professional experience across UE5 gameplay systems and proprietary engine tooling at AAA scale. Contributed to Amazon's New World: Aeternum on the Azoth engine and shipped multiplayer systems for Stainless Games. Currently deepening low-level knowledge through engine development with DirectX11.

WORK EXPERIENCE

Game Programmer | Stainless Games

Amazon's New World: Aeternum — Engine & Tools (C++ / Qt / Azoth Engine) Sep 2023 - Oct 2025

- Developed and shipped tools and engine features in C++ within Azoth, Amazon's proprietary AAA engine powering New World: Aeternum, collaborating across a team of 30+ engineers.
- Diagnosed and resolved a critical defect in the main entity parenting system: drag-dropped entities with child hierarchies were flattening on reparent; fixed to correctly preserve sub hierarchies on detach.
- Designed and implemented a shortcut-to-Python-script mapping tool, connecting the engine's existing shortcut system to a new script-reader layer, adopted across the full development team to accelerate workflow automation.
- Unified distance-based LOD rendering between the editor viewport and in-game by introducing a configurable offset bool, eliminating a longstanding visual discrepancy between editor preview and the shipped game.
- Extended the entity and component filtering architecture by adding new filtering class that filters entities based on the components' count, improving editor query performance and usability for content teams.

ShockRods — Multiplayer Matchmaking & UI (UE5 / C++)

- Integrated a Steam peer-to-peer matchmaking plugin, implementing hosted and joined session flows with password-protected room support.
- Built fully replicated UI systems for the main menu, matchmaking lobby, and session management in C++ and Blueprints.

Private IP — Core Gameplay UI (Unity / C#)

- Programmed core HUD elements like health, weapons, and abilities for an unannounced title.
- Architected a low-level UI animation system in C# for Unity UI, designed for compatibility across diverse visual elements.

Gameplay Programmer (Internship) | Sunrise Intelligence

Aug 2022 - Jan 2023

- Programmed character ability systems for a MOBA title in UE4 C++, implementing game-feel mechanics for multiple distinct characters.
- Designed and implemented a generalised Energy system covering regenerative and consumable resources (mana, health, stamina), built for extensibility across future characters.

PROJECTS

CardViz Plugin — UE5 · C++

- Designed and built a modular, fully documented UE5 C++ plugin for card and pile visualization, available on the Fab marketplace and itch.io with a live playable demo.
- Implemented an animation system using cached transform states and per-tick interpolation, enabling pile-driven card motion with zero hardcoded animations.
- Shipped three extensible pile types (Stacked, Grid, Fanned) via a BlueprintNativeEvent architecture, each with hover-grace logic solving card-snap feedback during mouse interaction.

Graduation Project | 3D Platformer — UE4 · C++

- Sole programmer on a full 3D platformer covering gameplay, AI, UI, and a multi-phase boss fight with distinct attack patterns.

DirectX 11 Renderer (Fado Engine) — C++ · DX11 · HLSL · Win32

- Building a 3D renderer from scratch in C++ on Win32 without engine abstraction.

SKILLS

Languages: C++ · C · C# · HLSL Version Control: Perforce (P4V) · Git / GitHub

Engines & Frameworks: Unreal Engine 4/5 · Unity · Godot · Qt · DirectX11

EDUCATION

B.Sc. Computer Science — German Jordanian University, Jordan
